

Module-2

Session 1

Q.1 Write a short paragraph in your own words defining what a 'program' is and give one real-life example from any app you use daily (like Instagram, Zomato, or Paytm).

Ans.

- A program is a set of instructions given to a computer to perform a specific task.
- It tells the computer what to do and how to do it. Programs are written using programming languages like Java, Python, and C++.
- We use many programs in our daily life without realizing it. For example, Instagram is an app that works using different programs.
- These programs allow us to upload photos, like posts, send messages, and watch videos.
Thus, a program helps us perform tasks easily and quickly.

Q.2 List three popular programming languages you have heard of, and for each, mention whether it is usually compiled, interpreted, or can both.

Hint: Think of languages like Java, Python, and JavaScript.

Ans.

1. **C** – Usually a **compiled** language.
2. **PHP** – Usually an **interpreted** language.
3. **C#** – Can be **both compiled and interpreted** depending on how it is executed.

Q.3 Draw a flowchart (on paper or using any online tool) for the process of booking a movie ticket on BookMyShow, starting from opening the app to receiving the booking confirmation.

Ans.

Select Seats

Confirm Booking Details

Make Payment

◇ Payment Successful?

→ No → Try Payment Again

→ Yes ↓

Booking Confirmed

Receive Booking Confirmation / Ticket

End

Q.4 Write down the steps (as an algorithm, using simple numbered instructions) for ordering food on Swiggy — from opening the app to completing payment.

Ans.

Algorithm: Ordering Food on Swiggy

1. Open the Swiggy app on your mobile phone.
2. Enter or select your delivery location.
3. Search for a restaurant or food item.
4. Select the restaurant and choose the food items.
5. Add the selected items to the cart.
6. Check the order details and total amount.
7. Enter or confirm the delivery address.
8. Select a payment method.
9. Make the payment for the order.
10. After successful payment, the order is placed and confirmed.

Session 2

Q.1 Install GCC on your computer and verify the installation by running `gcc --version` in your terminal or command prompt.

Ans.

Steps to Install GCC and Verify Installation.

1. Download and install GCC on the computer.
2. Open the Terminal or Command Prompt.
3. Type the command `gcc --version`.
4. Press **Enter**.
5. If GCC is installed correctly, the terminal will display the GCC version.
6. This confirms that GCC has been successfully installed and is ready to use.

Q.2 Open VS Code or DevC++ and create a new file named `hello.c`. Write a C program that prints 'Hello, Instagram World!' to the console.

Ans.

FILE :- `hello.c`

CODE :-

```
#include<stdio.h>

main()

{

    printf("Hello, Instagram World!");

}
```

OUTPUT :-

Hello, Instagram World!

Q.3 Identify and label the header, main function, and return statement in your hello.c program using comments.

Ans.

```
#include <stdio.h> // Header

main()           // Main Function
{
    printf("Hello, Instagram World!");

    return 0;     // Return Statement
}
```

Labels:

- **Header:** #include <stdio.h>
- **Main Function:** int main()
- **Return Statement:** return 0;

Q.4 Compile your hello.c file using the GCC command line (gcc hello.c -o hello) and run the output file to display the message in your terminal.

Hint: On Windows, the output file will be hello.exe; on Linux/Mac, it will be hello.

Ans.

IN CMD:-

```
D:\TOPS\C>gcc "hello insta.cpp" -o hello
```

```
D:\TOPS\C>hello.exe
```

OUTPUT:-

Hello, Instagram World!

Session 3

Q.4 Identify and correct the invalid variable names from this list: 1stPlayer, player_age, \$score, total-marks, userName.

Hint: Apply standard variable naming rules for your programming language. smjava

Ans.

According to standard variable naming rules:

1. **1stPlayer** – Invalid. Correct name: **firstPlayer**
2. **player_age** – Valid variable name.
3. **\$score** – Invalid. Correct name: **score**
4. **total-marks** – Invalid. Correct name: **total_marks**
5. **userName** – Valid variable name.
